Journal Full Title: Journal of Biomedical Research & Environmental Sciences

Journal Website Link: https://www.jelsciences.com

Journal ISSN: 2766-2276

Category: Multidisciplinary

Subject Areas: Medicine Group, Biology Group, General, Environmental Sciences

Topics Summation: 128

Issue Regularity: Monthly

Review Process: Double Blind

Time to Publication: 21 Days

Indexing catalog: Visit here

Publication fee catalog: Visit here

DOI: 10.37871 (CrossRef)

Plagiarism detection software: iThenticate

Managing entity: USA

Language: English

Research work collecting capability: Worldwide

Organized by: SciRes Literature LLC

License: Open Access by Journal of Biomedical Research & Environmental Sciences is licensed under a Creative Commons Attribution 4.0 International License. Based on a work at SciRes Literature LLC.

Manuscript should be submitted in Word Document (.doc or .docx) through Online Submission form or can be mailed to support@jelsciences.com

Vision: Journal of Biomedical Research & Environmental Sciences main aim is to enhance the importance of science and technology to the scientific community and also to provide an equal opportunity to seek and share ideas to all our researchers and scientists without any barriers to develop their career and helping in their development of discovering the world.
INTRODUCTION

• All RNA viruses, by entering the host cell, secure their own reproduction because its RNA is attached to the enzyme "RT - reverse transcriptase" to form an immediate "DNA library" that will be incorporated into the genome of the host cell by another enzyme - the "integrase".

• If this were not the case, viral infections caused by RNA viruses would not be possible, as the "proteases", in other words the scavenger cells, would destroy the viral RNA.

• The same applies to RNA or mRNA fragments to avoid the action of proteases.

• In addition, even if an RNA or mRNA fragment protected by some kind of encapsulation were to be introduced, it would never trigger ribosome activity to produce the SPIKE that, once expelled from the cell, is key to the immune response, because two preconditions are vital for activating the ribosomes:

1. A change in the "oxidation-reduction" state (REDOX state). The oxide/reductive state plays a fundamental role within the cell. It is to the cell what the pH is to the blood. The value of the oxide/reductive state conditions and establishes the activities of the cell.

2. Activation of "Nucleus Factors", the only ones that can spur the genome to initiate protein Synthesis.

Points 1 and 2 outline what happens every time a virus enters a cell because it alters its REDOX state, which then activates the 'Nucleus Factors'.

Never do ribosomes process an mRNA, unless it comes directly from the genome.

As a consequence, in order to stop the SPIKE, mRNA vaccines must be incorporated into the cell at its genomic level.

• Thus, mRNA is a misnomer because per se it will never be able to activate ribosomes [1-5].

DISCUSSION

In the COVID-19 mRNA vaccines in use, there can only be a fragment of viral RNA relating to the SPIKE already triggered by the enzyme 'RT - Reverse Transcriptase'.

A simple experiment is all it takes to substantiate this claim:

1. Inject a COVID-19 mRNA vaccine into a cell culture

2. After a set time period has elapsed, the action of SPIKE simulating a low frequency SARS-CoV2 infection will be noticeable.

The SPIKE that is acting is a genome expression of the cells in culture.
CONCLUSION

The manufacturers of the latest COVID-19 mRNA vaccines have been lying, alleging that the mRNA would produce the SPIKE, without integrating into the host cell genome, and ultimately destroying itself in the short term.

A worldwide pandemic cannot be stopped by scientific lies, which invalidate the fundamental principles of biology.
